Total score for patient SYN-PV-030:6

Causality assessment: Probable

Clinical rationale

Probable cases (score 5-6). Most of these sit at exactly 5, the lowest Probable score, and rely almost entirely on a positive rechallenge (+2). Each has a plausible temporal sequence and a pharmacologically recognised reaction (Q1). Examples are tendon pain with ciprofloxacin, myalgia with atorvastatin, oedema with amlodipine, nausea with metformin and rash with amoxicillin. Case 030 is the strongest at 6, with a positive dechallenge and a positive rechallenge. Case 024 is also strong, but the reaction is *Unexpected* (Q1 = 0), so it needs a labelling/signal review. The Probable label here rests on one piece of evidence, so it is fragile.

Possible cases (score 2-4). These have a temporal association and a known reaction, but the key evidence is missing or contradicts causality.
